Service	Service Description	Completed
Certified Arborist Services	<p>I met with Darryl on April 9th to evaluate his backyard Interior live oak and sent the following email on 4-10-24.</p> <p>This email is a report of my findings from the inspection on 4-4-24 of the Interior live oak (<i>Quercus wislizenii</i>) located in the backyard of 111 Lakeside Way in Folsom.</p> <ul style="list-style-type: none"> • Interior live oak (<i>Quercus wislizenii</i>): 11 and 17-inch Diameter Standard Height; 20 foot Dripline Radius; poor to fair structure and poor vigor. Located 13 feet west of the structure with canopy overhang. • Notable Characteristics: 12-inch diameter decaying stem attachment west side with evidence of borer activity, callusing basal wound 1 foot above grade west side where a 12-inch diameter stem was removed with a 4-inch diameter cavity opening. Evidence of bark beetle activity in 2 locations on the 17 -inch diameter northerly stem and carpenter worm holes at the base on the east and south sides. Foliage density on the southerly 11-inch diameter stem is 5 percent of average and the foliage density in the northerly stems is approximately 30 percent of average with significant dieback in the canopy of both stems. The ASCA Rating for this tree is 1. • Recommendation: Due to the significant decline in the tree's vigor and evidence of damaging boring insects with no effective mitigative treatments, removal is recommended. 	4/9/2024
